

CL-2005: Database Systems

Lab #12: Report Generation in C# using RDLC Application Forms with SQL Server.

Objective:

To make the windows application reports in C# through RDLC.

Scope:

The student shall know the following:

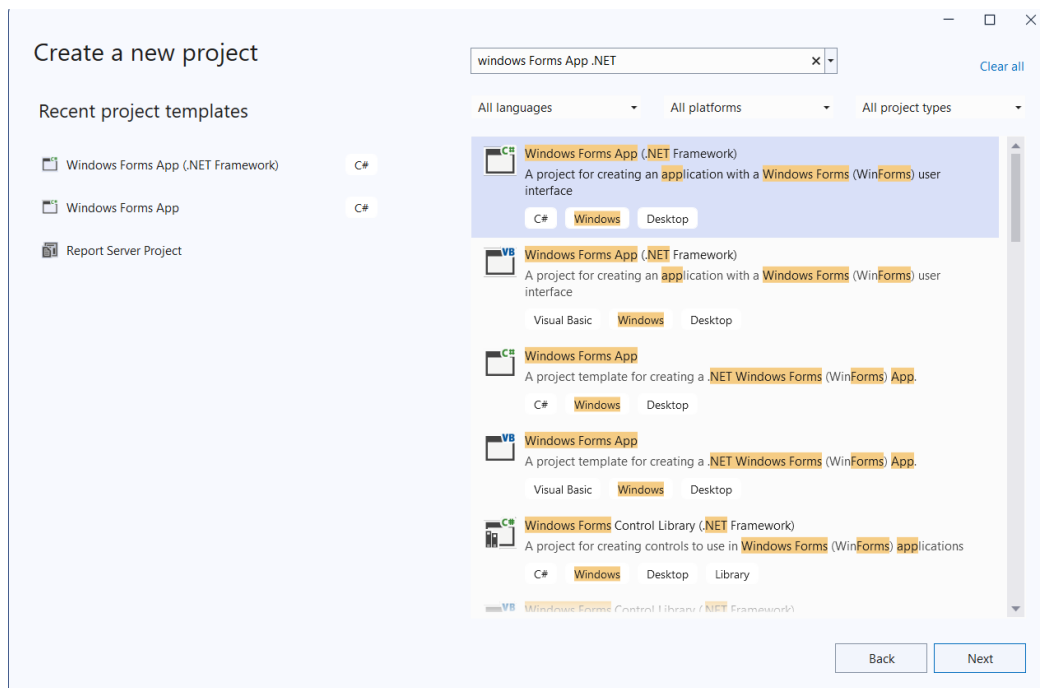

- SQL Commands.
- C# Programming
- Connection of Visual Studio with SQL Server.
- Forms Creation.
- Data insertion and verification through forms.

Discussion:

We have created a signup and login form in visual studio using C# and then connect it with SQL Server which is our database. Now we will generate reports using RDLC in Visual Studio,

Report Generation:

1. Create a New Project with Windows Forms App (.NET Framework):

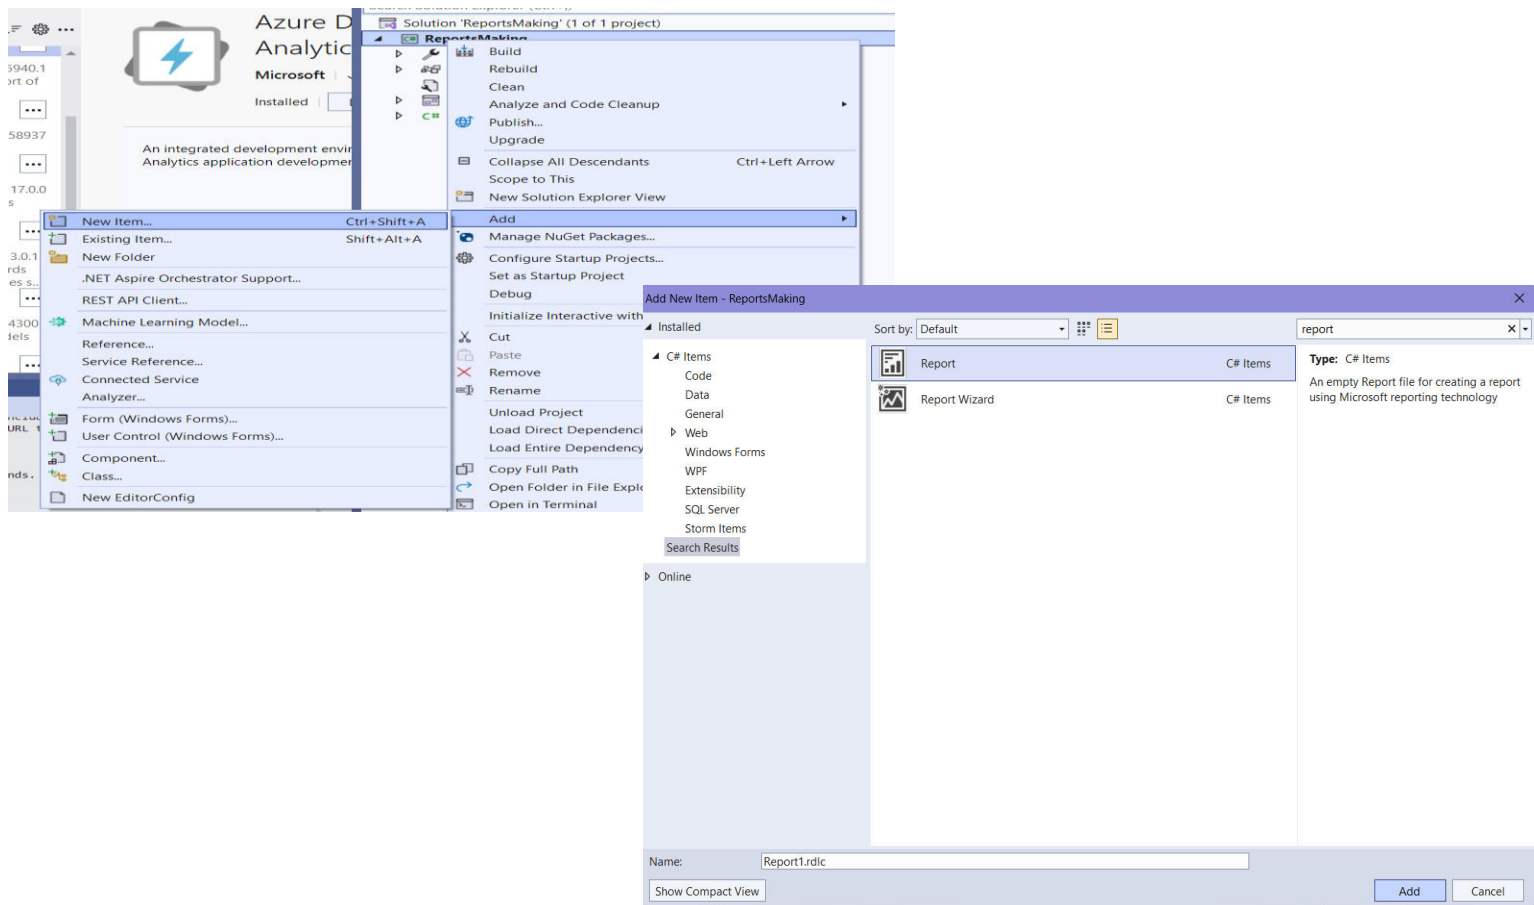

2. Connect to Database as thought in lab previously.
3. Install Nuget Extension ->Microsoft.Data.SqlClient.

4. Go to Extensions -> Manage Extensions and Install following two:

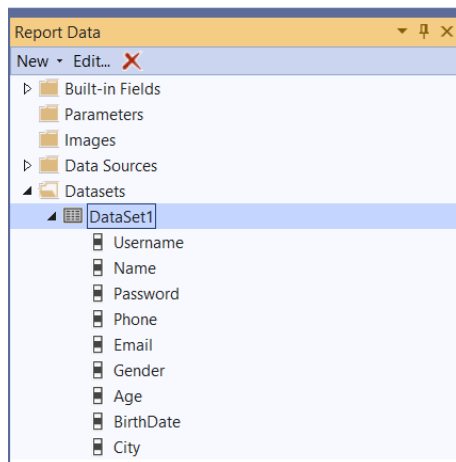

5. Go to Project and Add an item and Add report to your project.

6. In Report Design view, add report Data Sources from the right-side menu as shown:

7. **Dataset** has been added successfully.

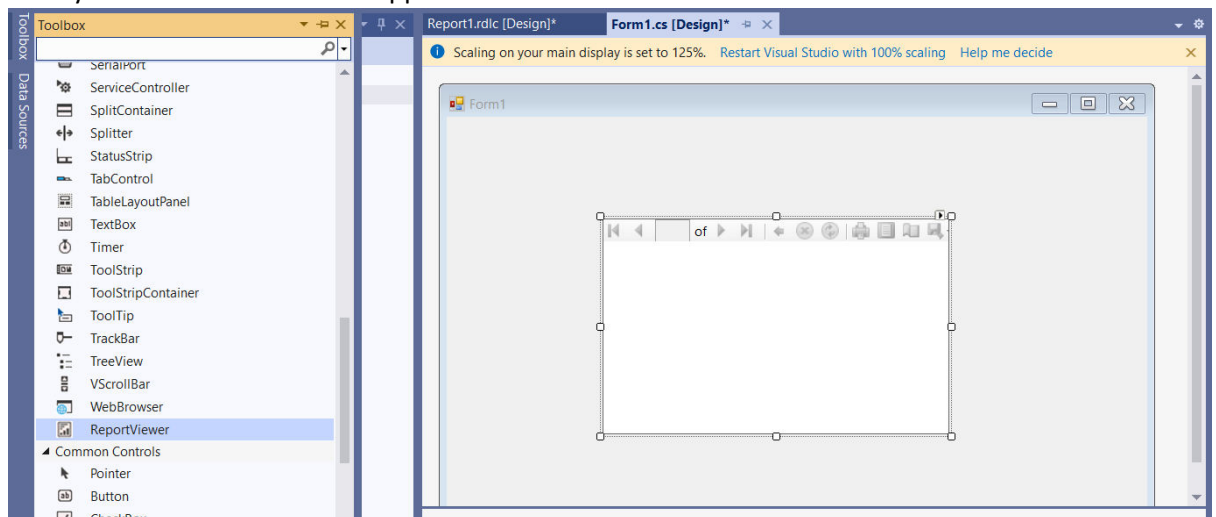

8. Go to Tools -> NuGet Package Manager -> Package Manager Console
And Enter following command in the Console:

Install-Package

Microsoft.ReportingServices.ReportViewerControl.WinForms

9. Once the package has been installed successfully you can easily drag and drop ReportViewer from your Toolbox to the form application.

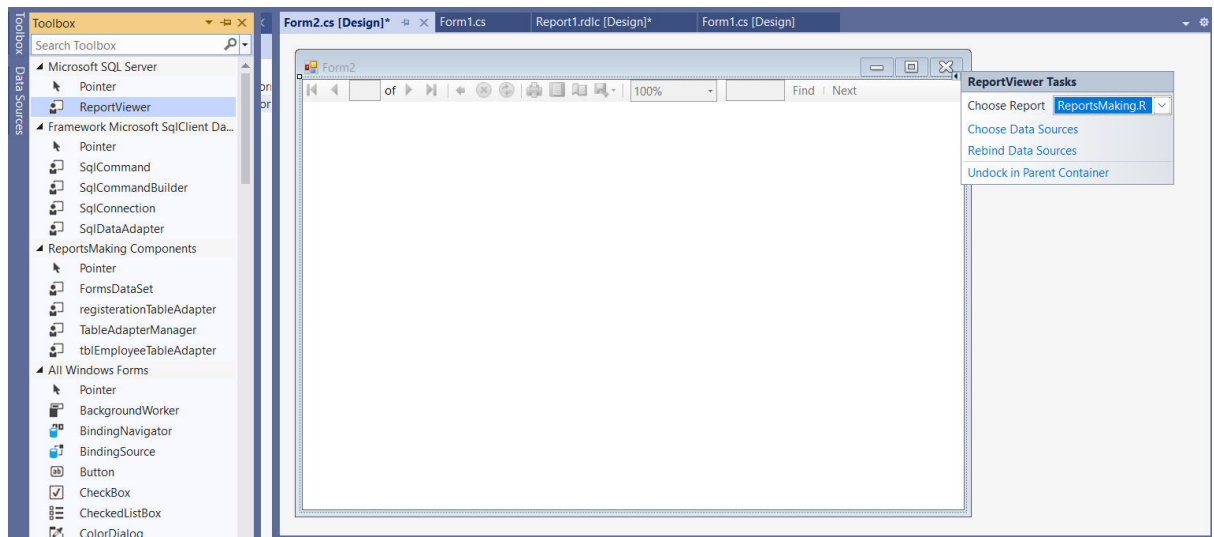

10. Go to Report1.rdlc and design your report with Toolbox however you want. We can add Header and Footer. Add a table from the Data Source and so on.

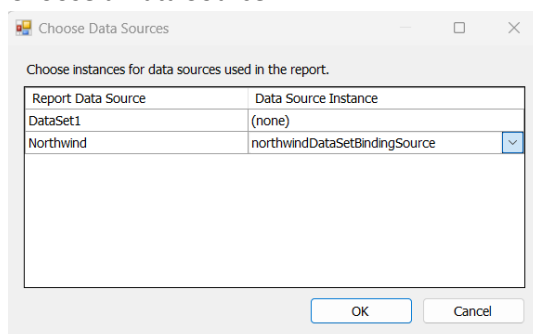

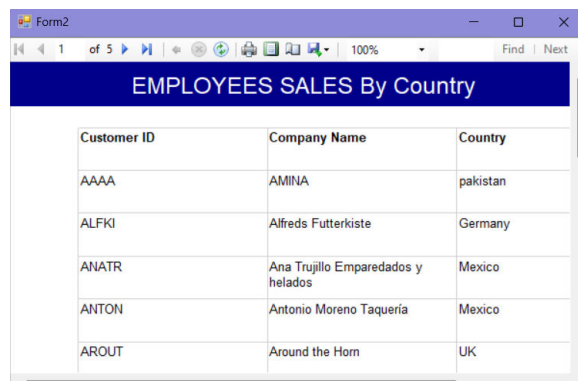

11. Go back to the form where we added the reportviewer and Select the Report1.rdlc as the desired report to view from this viewer.

12. Choose a Data Source.

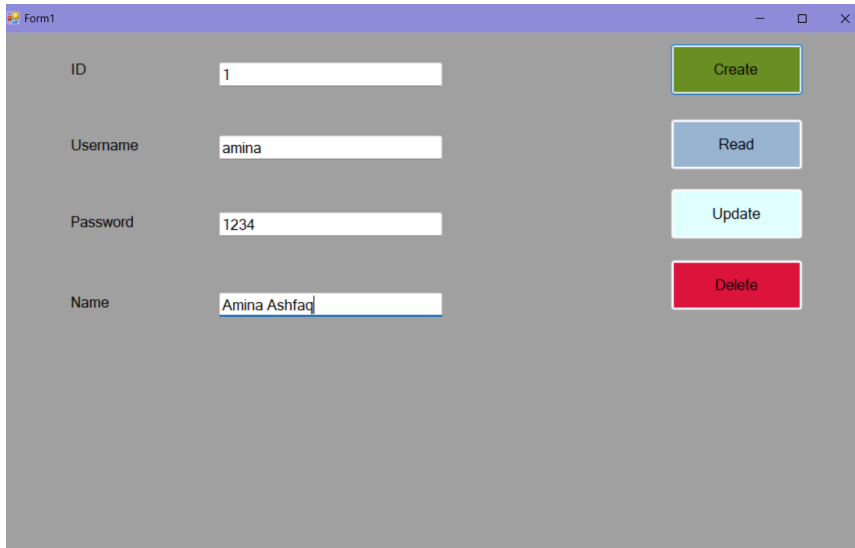

13. Run the project now and the report will be displayed.

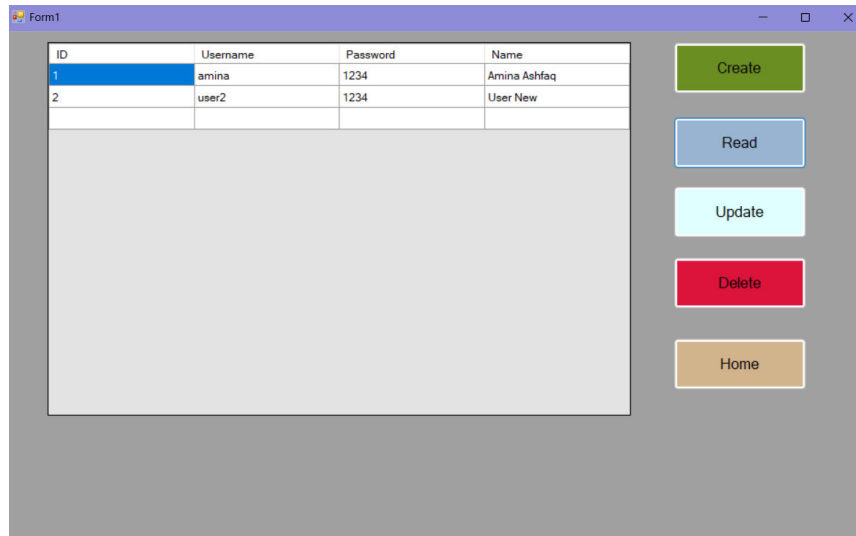

Customer ID	Company Name	Country
AAAA	AMINA	pakistan
ALFKI	Alfreds Futterkiste	Germany
ANATR	Ana Trujillo Emparedados y helados	Mexico
ANTON	Antonio Moreno Taquería	Mexico
AROUT	Around the Horn	UK

Lab Task:

1. Develop a windows form application that performs following operations.
2. **Create button:** To insert new user to your database.

3. **Read button:** To display all the records in dataGridview when clicked.

ID	Username	Password	Name
1	amina	1234	Amina Ashfaq
2	user2	1234	User New

4. **Update button:** To update any record from the table based on the ID.
5. **Delete button** should be able to delete a record
6. After **CRUD** Operations make a button that **generates report** of the desired data (get the data from northwind). Export your report into a PDF.
